

Pending Claims:

1. A method for generating a dump file, the method comprising:
- a. generating a dump file that does not include all operating system data by gathering at least:
 - i. thread information for at least one running thread,
 - ii. context information for the thread,
 - iii. callstack information for the thread,
 - iv. process information for a process in which the thread is running, and
 - v. information identifying a reason for generating the dump file; and
 - b. storing the dump file to a storage medium.
2. The method as recited in Claim 1, further comprising determining when to generate the dump file.
3. The method as recited in Claim 1, wherein generating the dump file further includes gathering processor information about at least one processor.
4. The method as recited in Claim 2, wherein determining when to generate the dump file further includes determining that an exception has occurred.

- BT
C1
- 1
 - 2 5. The method as recited in Claim 1, wherein the dump file does not
 - 3 include data stored in global initialized memory.
 - 4
 - 5
 - 6 6. The method as recited in Claim 1, wherein the dump file does not
 - 7 include data stored in uninitialized memory.
 - 8
 - 9 7. The method as recited in Claim 1, wherein the dump file does not
 - 10 include executable instructions used by a processor to execute a
 - 11 program.
 - 12
 - 13 8. The method as recited in Claim 1, wherein the dump file is a kernel
 - 14 minidump file associated with an operating system and the at least one
 - 15 running thread is the single thread which encountered an exception.
 - 16
 - 17 9. The method as recited in Claim 8, wherein the callstack information
 - 18 includes kernel stack information.
 - 19
 - 20 10. The method as recited in Claim 1, wherein the process information
 - 21 identifies a process that initiated the thread.
 - 22
 - 23
 - 24
 - 25

- BT
C1
- 1 11. The method as recited in Claim 1, further comprising:
 - 2 allocating a buffer space in memory during an initialization
 - 3 process, wherein the buffer space is suitable for storing the gathered
 - 4 information; and
 - 5 reserving space on the storage medium suitable for writing
 - 6 the contents of the buffer space.
 - 7
 - 8 12. The method as recited in Claim 11, wherein generating the dump file
 - 9 further includes initially storing the thread information, the context
 - 10 information, the callstack information, the process information, and the
 - 11 information identifying the reason for generating the dump file to the
 - 12 buffer space, and then copying the dump file from the buffer space to
 - 13 the storage medium as a minidump file.
 - 14
 - 15 13. The method as recited in Claim 12, further comprising upon re-
 - 16 initialization, after having stored the minidump file to the storage
 - 17 medium, accessing the minidump file on the storage medium and using
 - 18 at least a portion of the minidump file to further understand an
 - 19 exception that was at least one reason for generating the minidump file.
 - 20
 - 21 14. The method as recited in Claim 1, wherein the dump file is a user
 - 22 minidump file associated with at least one non-operating system
 - 23 program.
 - 24
 - 25

bx
cl

- 1 15. The method as recited in Claim 1, wherein generating the dump file
- 2 further includes gathering callstack information for all running threads.
- 3
- 4 16. The method as recited in Claim 15, wherein the callstack information
- 5 includes a user callstack.
- 6
- 7 17. The method as recited in Claim 1, wherein generating the dump file
- 8 further includes gathering processor context information for all running
- 9 threads.
- 10
- 11 18. The method as recited in Claim 1, wherein generating the dump file
- 12 further includes gathering a listing of loaded modules for a faulting
- 13 application program.
- 14
- 15 19. The method as recited in Claim 1, wherein the dump file is a directory
- 16 indexed file that uses relative virtual addresses (RVAs).
- 17
- 18
- 19
- 20
- 21
- 22
- 23
- 24
- 25

1 20. A computer-readable medium having computer-executable instructions
2 for causing at least one processor to perform acts comprising:

3 gathering dump file information that does not include all
4 operating system data but does include at least thread information for at
5 least one running thread, context information for the thread, callstack
6 information for the thread, process information for the process in which
7 the thread is running, and information identifying a reason for
8 generating the dump file; and generating a dump file using the dump file
9 information.
10

11 21. The computer-readable medium as recited in Claim 20, wherein
12 generating the dump file further includes storing the dump file to a
13 storage medium.
14

15 22. The computer-readable medium as recited in Claim 20, wherein
16 gathering the dump file information further includes gathering
17 processor information about at least one processor.
18

19 23. The computer-readable medium as recited in Claim 20, having further
20 computer-executable instructions for causing the at least one processor
21 to perform acts comprising determining when to generate the dump
22 file.
23

24 24. The computer-readable medium as recited in Claim 20, wherein the
25 dump file does not include data stored in global initialized memory.

- BT
CI
- 1
 - 2 25. The computer-readable medium as recited in Claim 20, wherein the
 - 3 dump file does not include data stored in uninitialized memory.
 - 4
 - 5 26. The computer-readable medium as recited Claim 24 wherein the dump
 - 6 file does not include executable instructions used by the at least one
 - 7 processor to execute a program.
 - 8
 - 9 27. The computer-readable medium as recited in Claim 20, wherein the
 - 10 dump file is a kernel minidump file associated with an operating
 - 11 system and the at least one running thread is the single thread which
 - 12 encountered an exception.
 - 13
 - 14 28. The computer-readable medium as recited in Claim 20, wherein the
 - 15 callstack information includes kernel stack information.
 - 16
 - 17 29. The computer-readable medium as recited in Claim 20, wherein the
 - 18 process information identifies a process that initiated the thread.
 - 19
 - 20
 - 21
 - 22
 - 23
 - 24
 - 25

1 30. The computer-readable medium as recited in Claim 20, further
2 comprising computer-executable instructions for causing the at least
3 one processor to perform acts comprising:

4 allocating a buffer space in memory during an initialization process,
5 wherein the buffer space is suitable for storing the dump file
6 information; and

7 reserving space on a storage medium drive suitable for writing the
8 contents of the buffer space.

9
10 31. The computer-readable medium as recited in Claim 30, wherein
11 generating the dump file further includes initially storing the thread
12 information, the context information, the callstack information, the
13 process information, and the information identifying the reason for
14 generating the dump file to the buffer space, and then copying the
15 dump file from the buffer space to the storage medium as a minidump
16 file.

17
18
19 32. The computer-readable medium as recited in Claim 31, further
20 comprising computer-executable instructions for causing the at least
21 one processor to perform acts comprising, upon re-initialization after
22 having stored the minidump file to the storage medium, accessing the
23 minidump file on the storage medium and using at least a portion of the
24 minidump file to further understand an exception that was at least one
25 reason for generating the minidump file.

33. The computer-readable medium as recited in Claim 20, wherein the dump file is a user minidump file associated with at least one non-operating system program.
34. The computer-readable medium as recited in Claim 20, wherein gathering the dump file information further includes gathering callstack information for all running threads.
35. The computer-readable medium as recited in Claim 34, wherein the callstack information includes a user callstack.
36. The computer-readable medium as recited in Claim 20, wherein gathering the dump file information further includes gathering processor context information for all running threads.
37. The computer-readable medium as recited in Claim 20, wherein gathering the dump file information further includes gathering a listing of all loaded modules for the faulting application program.
38. The computer-readable medium as recited in Claim 20, wherein the dump file is a directory indexed file that uses relative virtual addresses (RVAs).

- 1 39. An apparatus comprising;
2 memory;
3 a data storage drive configured to write data files to at least one data
4 storage medium; and
5 at least one processor operatively coupled to the memory and the data
6 storage drive and configured to:
7 a. generate a dump file that does not include all operating system
8 data by gathering in the memory at least:
9 i. thread information for at least one running thread,
10 ii. context information for the thread,
11 iii. callstack information for the thread,
12 iv. process information for the process in which the thread is
13 running, and
14 v. information identifying a reason for generating the dump
15 file; and
16 b. store the dump file to the storage medium.
17
18 40. The apparatus as recited in Claim 39, wherein the at least one processor
19 is further configured to determine when to generate the dump file.
20
21 41. The apparatus as recited in Claim 39, wherein the at least one processor
22 is further configured to gather processor information about the at least
23 one processor and include the processor information in the dump file.
24
25

- 1 42. The apparatus as recited in Claim 40, wherein the at least one processor
2 is further configured to determining when to generate the dump file
3 based on an exception.
4
- 5 43. The apparatus as recited in Claim 39, wherein the dump file does not
6 include data stored in global initialized memory.
7
- 8 44. The apparatus as recited in Claim 39, wherein the dump file does not
9 include data stored in uninitialized memory.
10
- 11 45. The apparatus as recited Claim 39 wherein the dump file does not
12 include executable instructions used by the at least one processor to
13 execute a program.
14
- 15 46. The apparatus as recited in Claim 39, wherein the dump file is a kernel
16 minidump file associated with an operating system and the at least one
17 running thread is the single thread which encountered an exception.
18
- 19 47. The apparatus as recited in Claim 39, wherein the callstack information
20 includes kernel stack information.
21
- 22 48. The apparatus as recited in Claim 39, wherein the process information
23 identifies a process that initiated the thread.
24
25

1 49. The apparatus as recited in Claim 39, wherein the at least one processor
2 is further configured to:

3 allocate a buffer space in the memory during an initialization
4 process; and

5 reserve space on the storage medium drive suitable for writing the
6 contents of the buffer space.

7
8 50. The apparatus as recited in Claim 49, wherein the at least one processor
9 is further configured to:

10 generate the dump file by initially storing the thread information, the
11 context information, the callstack information, the process information,
12 and the information identifying the reason for generating the dump file
13 to the buffer space, and then copying the dump file from the buffer
14 space to the storage medium as a minidump file.

15
16 51. The apparatus as recited in Claim 50, wherein the at least one processor
17 is further configured to, upon re-initialization after having stored the
18 minidump file to the storage medium, access the minidump file on the
19 storage medium and use at least a portion of the minidump file to
20 further understand an exception that was at least one reason for
21 generating the minidump file.

22
23 52. The apparatus as recited in Claim 39, wherein the dump file is a user
24 minidump file associated with at least one non-operating system
25 program.

1
2 53. The apparatus as recited in Claim 39, wherein the at least one processor
3 is further configured to gather callstack information for all running
4 threads as part of the dump file.

5
6 54. The apparatus as recited in Claim 53, wherein the callstack information
7 includes a user callstack.

8
9 55. The apparatus as recited in Claim 39, wherein the at least one processor
10 is configured to gather processor context information for all running
11 threads as part of the dump file.

12
13 56. The apparatus as recited in Claim 39, wherein the at least one processor
14 is configured to gather a listing of all loaded modules for a faulting
15 application program as part of the dump file.

16
17 57. The apparatus as recited in Claim 39, wherein the dump file is a
18 directory indexed file that uses relative virtual addresses (RVAs).

19
20 67. The method as recited in Claim 1, further comprising providing the
21 dump file to at least one external device.

22
23 68. The method as recited in Claim 12, upon system re-initialization,
24 transferring the dump file from the storage medium to at least one
25 external device.

BT
C

1
2 69. The method as recited in Claim 1, wherein generating the dump file
3 further includes gathering a list of loaded modules.
4

5 70. The computer-readable medium as recited in Claim 20, having further
6 computer-executable instructions for causing the at least one processor
7 to perform acts comprising providing the dump file to at least one
8 external device.
9

10 71. The computer-readable medium as recited in Claim 30, having further
11 computer-executable instructions for causing the at least one processor
12 to perform acts comprising, upon system re-initialization, transferring
13 the dump file from the storage medium to at least one external device.
14

15 72. The computer-readable medium as recited in Claim 20, wherein
16 gathering the dump file information further includes gathering a list of
17 loaded modules.
18

19 73. The apparatus as recited in Claim 39, wherein the at least one processor
20 is further configured to provide the dump file to at least one external
21 device.
22

23 74. The apparatus as recited in Claim 49, wherein the at least one processor
24 is further configured to, upon system re-initialization, transferring the
25 dump file from the storage medium to at least one external device.

75. The apparatus as recited in Claim 39, wherein the at least one processor is further configured to gather a list of loaded modules as part of the dump file.
